Scope	Clarity	Enforcement	Student Protections	Faculty and Staff Rights	Update Cadence
3.5	3	2.5	2	4	2
Both students and some faculty uses are covered under the policy, and maybe staff, indirectly.	The Information Technology and Data Policies section is unclear: to whom does this apply, and what is the rationale for this seemingly arbitrary stance?	Consequences are alluded to but not directly mentioned, nor are the relevant policies.	Mentioned as being essential in the second tab but otherwise not covered.	It's clear faculty can do what they want in their classes, but there's not enough coverage of uses beyond that.	Points for included a "last updated" date, but it was last updated in November 2023.

Synthesis

Of the three policies, I think the Minnesota policy is the strongest overall by virtue of considering many different aspects of AI use in the classroom and in instructor syllabus policies. I will, however, give an honorable mention to the Texas policy for being the only one to at least acknowledge the existence of people other than faculty and students. Overall, I would say that the Texas policy is the only one which begins to resemble a university-wide policy, while the Wisconsin and Minnesota policies appear to be at best narrow treatments of how AI should be handled on a syllabus. That mirrors what I see at U of A, where syllabus policies (and research) seem to be major focuses and other potential uses are not addressed. The most common gap

I saw between these three policies was update cadence. Only one included a “last updated” date, and none actually mentioned when they might be updated in the future. However, all three policies do have an “evergreen” feel to them in that they’re intended to not make pronouncements on specific tools or technologies so that they’ll be effective for longer rather than requiring updates on a regular basis.
