

NIST AI RMF: Applicable Provisions

Principle/Provision	Quote	Institutional Scenario	Operational Implication for My Role
Map 3.1	“Potential benefits of intended AI system functionality and performance are examined and documented.”	using an LLM to run thematic analysis on anonymized student session feedback	This would require considering and documenting what we would expect to gain by using an LLM for this task. Would we save time? Gain additional insight?
Map 3.2	“Potential costs, including non-monetary costs, which result from expected or realized AI errors or system functionality and trustworthiness – as connected to organizational risk tolerance – are examined and documented.”	using an LLM to run thematic analysis on anonymized student session feedback	This would require considering and documenting how this process could go wrong. This could include not saving time, generating untrustworthy outcomes, or generating outcomes which are untrustworthy enough that they require considerable human checking (which would then take up a lot of time). We would also need to consider who would run these reports and how much they would be used. The primary risk in the typical sense would come from someone failing to anonymize/pseudonymize the data before entering it, although since we’d still be using university-provided LLMs, this would likely still be relatively low risk.
Map 3.5	“Processes for human oversight are defined, assessed, and documented in accordance with	using an LLM to run thematic analysis on anonymized student session feedback	We would need to consider and document an optimal way in which the feedback reports would be generated and how we’d engage in routine checks of the outputs to make sure that they’re reliable and what we expect them to be. It would be easy for this to fall by the

	organizational policies from the GOVERN function.”		wayside once the process becomes embedded in our work.

UNESCO Recommendation Executive Summary: Applicable Provisions

Principle/Provision	Quote	Institutional Scenario	Operational Implication for My Role
right to privacy and data protection	“Privacy...must be respected, protected and promoted throughout the life cycle of AI systems.”	a hypothetical scenario in which we’re considering deploying AI systems in our admissions process (I don’t work in admissions, though, so I don’t know what they’re up to)	If I’m one of the more knowledgeable people about AI in our organization, I might be able to provide additional perspective on how we might go about respecting the privacy of applicant data.
human oversight and determination	“...the decision to cede control in limited contexts remains that of humans, as humans can resort to AI systems in decision-making and acting, but an AI system can never replace ultimate human responsibility and accountability.”	a hypothetical scenario in which we’re considering deploying AI systems in our admissions process (I don’t work in admissions, though, so I don’t know what they’re up to)	If I’m one of the more knowledgeable people about AI in our organization, I could provide some perspective on the points at which human oversight would be necessary and/or desirable and on whether we’re overall ceding too much control of the process.
awareness and literacy	“Public awareness and understanding of AI technologies and the value of data should be promoted through open and accessible	engagement/discussions with our students on appropriate use of AI in classes and in professional contexts	If AI continues to be a simmering concern at the college, putting together some kind of task force or discussion group that includes students,

	education, civic engagement, digital skills and AI ethics training, media and information literacy and training...”		staff, and faculty could be very useful in informing the college’s stance on and approach to the use of AI tools.

Final Reflection

After completing the table, write 3 sentences: Which framework (NIST or UNESCO) is more immediately actionable for your role, and why?

I think the NIST framework is more actionable for my role. Some of the NIST provisions feel that they’re more easily achievable by one person working on a task (which is also why I chose all MAP roles because the GOVERN roles feel much more administrative and much more consultative). The UNESCO provisions would require much more working together with others, which I’m fine doing, but if I’m asked for the organizational implications for **my** role, then I’m inclined to focus more on what I can do myself.
