

Task name	Frequency	Time/Instance	Cognitive demand (1-5)	AI integration potential (1-5)	Data sensitivity (1-5)	Top candidate? (Y/N)
preparing meeting agendas	every 1-2 weeks	15-60 minutes, depending on the meeting	3-4	2	2	N
review & give feedback on session materials	varies; a few times a week	45-60 minutes	4-5	5	2-3	Y
build in-session materials (+/- prework activities) in Allele	varies; a few times a week	for existing sessions, 60-90 minutes for overhauled sessions, 2-4 hours	1	1	2	N
build learning events in VetMed Hub	varies; a few times a week	15 minutes	1	1	1	N
review & analyze student session and course feedback	~monthly	15-30 minutes	4	4	2 if data anonymized 4 if not anonymized	Y

Reviewing and giving feedback on session materials is a core function of what I do as an instructional designer. There's high potential for AI integration because it involves reviewing a lot of text, how all those parts fit together, and how they align with the session objectives, course objectives, and other sessions in the course. Generally, that's something that AI can do well, but it's also important enough to us that I would be cautious about selecting this as a candidate for AI integration, even if all steps of the task are within-frontier tasks.

Reviewing and analyzing student feedback was the idea for AI integration that I carried into this course. Many of our courses collect student feedback from each course session, and while we and our faculty review it, the reviews aren't systematic. We also are unable to take advantage of analyzing all the feedback collectively because it's simply too much text and we don't have the time to run a systematic qualitative analysis. There are some concerns around anonymizing the data (not just removing student names and e-mails, but also using pseudonyms for college faculty and staff, plus some of that feedback being rather pointed), but I think with care, that could be addressed. Whether all of this task is within-frontier, though, I think is an open question.
